

## OVERSPEED SPEED SWITCH, GHM9 SERIES, ROBUSTECH™

The overspeed switch function on the **ROBUSTECH™** range – a sturdy mechanical security module without external power supply:

- radial commutation centrifugal switch without permanent contact
- high quality mechanics reliability
- excellent repeatability
- secured system, works without power supply
- modular mounting possibility
- commutation speed : standard calibration range between 800 and 4 000 rpm (rotation per minute)

Especially designed for heavy duty industry (steel and paper mills, lumber, cranes, engine etc...). Sturdy compact conception.  
Excellent resistance to shocks/vibrations and to extreme axial/radial loads  
12mm or 11mm solid shaft with 115mm REO (Euroflange B10) for tacho-generator type mounting

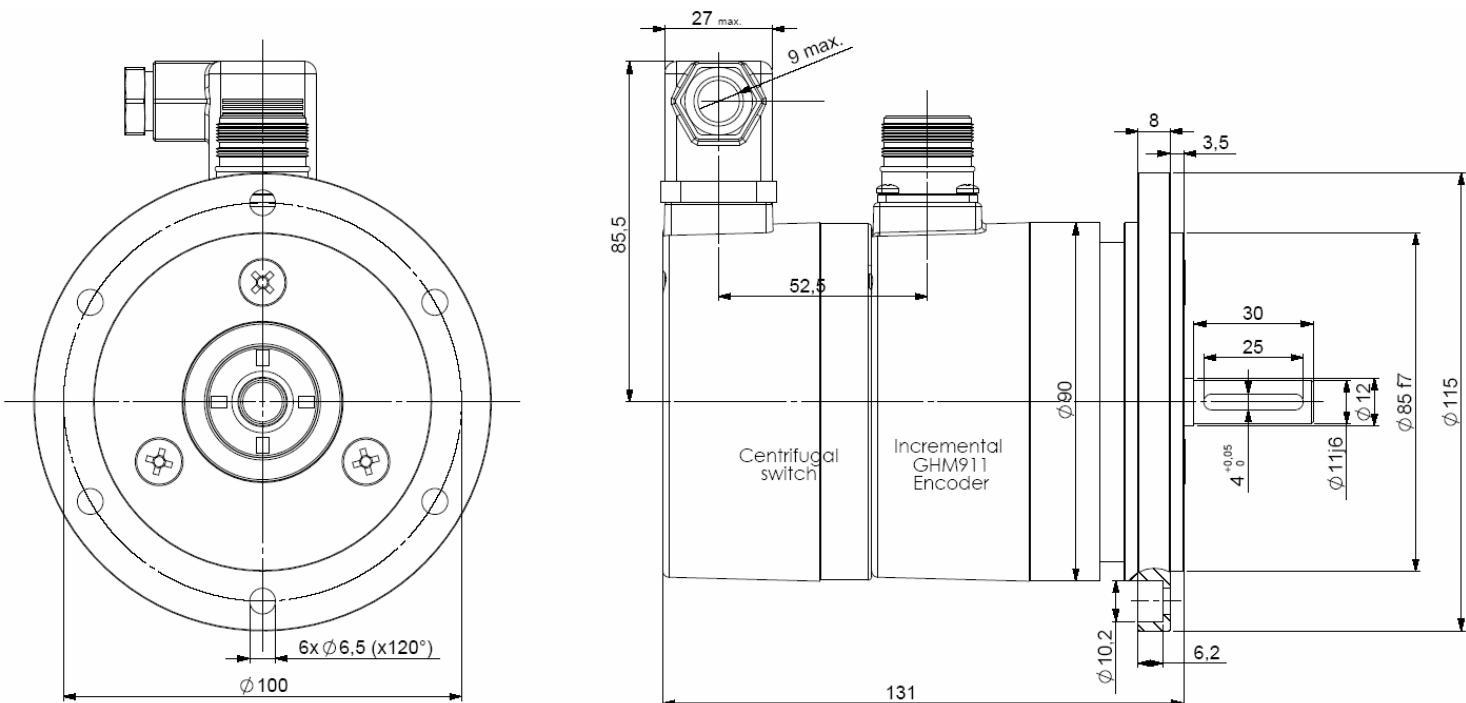

Solid shaft GHM9\_11 with overspeed switch

Solid shaft GHM9\_12 with overspeed switch

The compactness of the assembly, which can be proposed by BEI IDEACOD, allows the combination of overspeed switch and encoder presenting a particularly interesting cost / performances relation

### EXAMPLE : INCREMENTAL ENCODER GHM9\_11 WITH OVERSPEED SWITCH

### CENTRIFUGAL SWITCH CHARACTERISTICS

Material	Cover : zinc alloy Body: aluminium	Weight	1,10kg
		Operating temperature	-30 ... +130°C
Max. speed	1,5 . n <sub>s</sub>	IP(EN 60529)	IP 67 (mounted)

## OVERSPEED SPEED SWITCH, GHM9 SERIES, ROBUSTECH™

### CHARACTERISTICS

Switching speed	800 ... 4 000 rpm	Max current	6 A / 240 Vac
Principle	centrifugal	Contact material	silver-cadmium
Mechanical life-time	500 000 cycles	Maximum breaking sequence	4/min
Contact type	opened or closed	Breaking accuracy	min <sup>-1</sup> - 5% ... +8%

The commutation speed  $n_s$  is definitely calibrated in our factory

Right or left rotation direction

The switching speed  $n_s$  is defined for an acceleration =  $100 \text{ s}^{-2}$  (other, consult us)

Nota:  $1 \text{ rad.s}^{-2} \leftrightarrow 9,55 \text{ rpm.s}^{-1}$

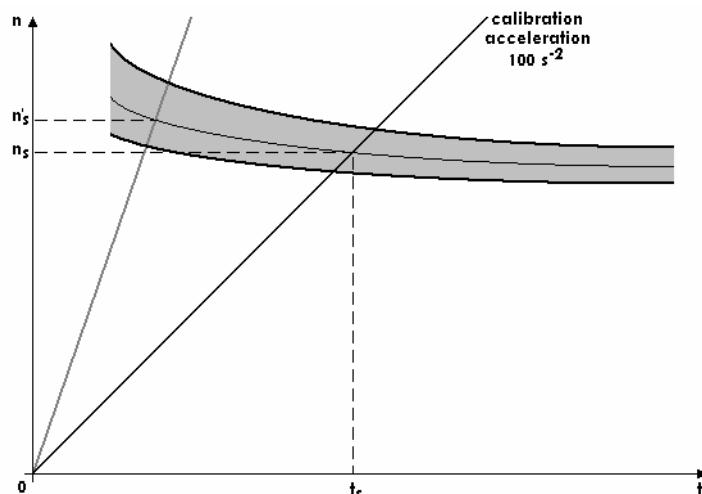

The hysteresis is about -3% in counter clockwise direction compared with clockwise direction

It is advised to choose the switching speed  $n_s$  in order that  $n_s > 1,15 \cdot n_n$  ( $n_n$ : working speed, nominal speed)

The centrifugal relay must be used only in the case of an increasing speed

In decreasing speed, the centrifugal switch will open automatically at a slower speed of approximately 40% of the calibrated switching speed  $n_s$

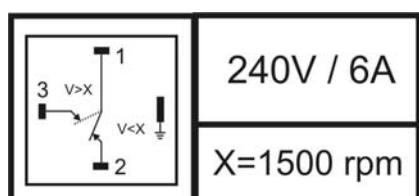

In the case of a higher acceleration than  $100 \text{ s}^{-2}$ , the switching speed will be higher ( $n_s$ , cf here-under drawing)

### STANDARD CONNECTION

With 4 pinout solenoid valve connector

Contact 1 to 3 can be connected according to the desired configuration (rest, work or opposite)

The earth pin of the connector must be connected to the ground of the installation

### AVAILABLE COMBINATION

(Consult us for special version: ex: flange / connection / specific speed...)

Available combination

- incremental encoder + overspeed switch
- tacho-encoder + overspeed switch
- absolute encoder + overspeed switch
- incremental encoder + opto-tacho + overspeed switch
- overspeed switch + overspeed switch ...

Standard speeds (rpm) : 1 000, 1 200, 1 500, 1 800, 3 000 (consult us for other speed)

Reference: consult us

Note : The switch commutation speed is calibrated in our factory, no correction and no later modification is possible
